What is Quantum Chemistry?

- Visible system Classical mechanics (Newton's law)

(m, cm, g, ...)

$$F = m \frac{d^2x}{dt^2}, \dots$$

$$F_1 = F_2 = G \frac{m_1 \times m_2}{r^2}$$

- Invisible system Quantum mechanics
($10^{-10}\text{m} = 1\text{\AA}$,)

Quantum mechanics
Schrodinger equation

$$-\frac{\hbar^2}{2m} \nabla^2 \psi(\mathbf{r}) + V(\mathbf{r}) \psi(\mathbf{r}) = E \psi(\mathbf{r})$$

Schrodinger Equation

$$H(r)\Psi(r) = E\Psi(r)$$

$$\left(-\frac{\hbar^2}{2m}\nabla^2 + V(r)\right)\Psi(r) = E\Psi(r)$$

$$-\frac{\hbar^2}{2m}\nabla^2\Psi(r) + V(r)\Psi(r) = E\Psi(r) \quad \text{and } \nabla^2 = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2}$$

- The solution of Schrodinger equation is wave function (Ψ).
- Quantum Chemistry is to solve Schrodinger equation of molecule or solid.
- Exact wave function (Ψ) of some system (if we can know) provides many pragmatic chemical information of matter, such as energy, structure, spectrum, color, dipole moment, (hyper-)polarizability....

Erwin Schrodinger

Schrodinger Equation

- The Schrodinger equation for the hydrogen atom can be solved exactly.
- $|\Psi| \times |\Psi|$ means an electron density (ρ) of the system.
- The concept of orbital.
- However, Schrodinger equation is **nonlinear 2nd differential equation**. It is impossible to solve it exactly if the system has more than 2 electrons (H atom, He⁺, H₂⁺).
- To solve the Schrodinger equation of general system, inevitably we should use some approximations.
- One of the most important approximation methods is Hartree-Fock approximation.

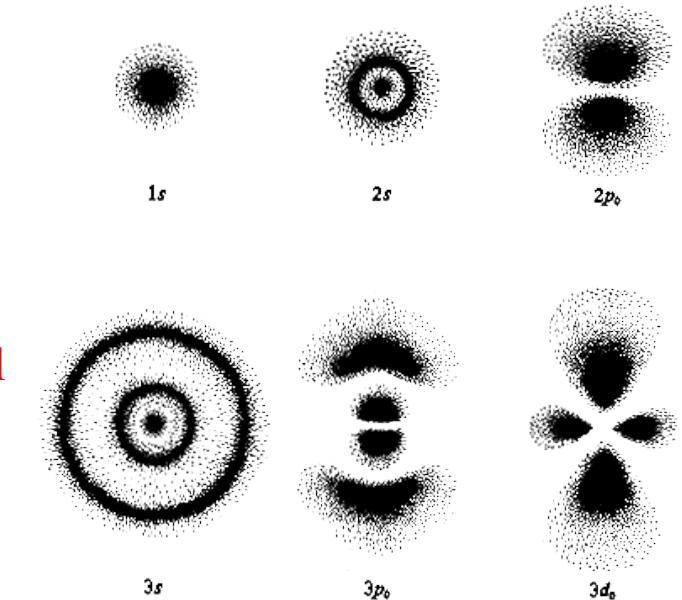

Figure 6-12. Probability density plots of some hydrogen atomic orbitals. The density of the dots represents the probability of finding the electron in that region.

© 1983 University Science Books; "Quantum Chemistry" by Donald A. McQuarrie

Hartree-Fock (HF) method

$$\Psi_0 = \Psi_{HF} = \Psi^{SD}(r_1, r_2, \dots, r_N) = (N!)^{-1/2} \begin{vmatrix} \Phi_1(x_1) & \Phi_2(x_1) & \dots & \Phi_N(x_1) \\ \Phi_1(x_2) & \Phi_2(x_2) & \dots & \Phi_N(x_2) \\ \vdots & \vdots & \vdots & \vdots \\ \Phi_1(x_N) & \Phi_2(x_N) & \dots & \Phi_N(x_N) \end{vmatrix}$$

$$\langle \Phi_i | \Phi_j \rangle = \delta_{ij}$$

$$\mathbf{FC} = \mathbf{SC}\boldsymbol{\epsilon}$$

$$H = - \underbrace{\sum_{i=1}^N \frac{1}{2} \nabla_i^2}_{T_e} - \underbrace{\sum_{A=1}^M \frac{1}{2M_A} \nabla_A^2}_{T_n} - \underbrace{\sum_{i=1}^N \sum_{A=1}^M \frac{Z_A}{r_{iA}}}_{V_{en}} + \underbrace{\sum_{i=1}^N \sum_{j>i}^N \frac{1}{r_{ij}}}_{V_{ee}} + \underbrace{\sum_{A=1}^M \sum_{B>A}^M \frac{Z_A Z_B}{R_{AB}}}_{V_{nn}}$$

Born-Oppenheimer Approximation $\rightarrow T_N=0, V_{NN}=ct$

$$H_{elec} = - \sum_{i=1}^N \frac{1}{2} \nabla_i^2 - \sum_{i=1}^N \sum_{A=1}^M \frac{Z_A}{r_{iA}} + \sum_{i=1}^N \sum_{j>i}^N \frac{1}{r_{ij}}$$

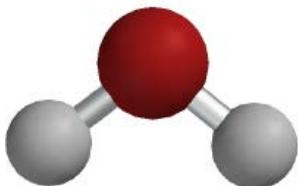

- Hartree Product $[\Psi(r_1, r_2) = \phi(r_1) \phi(r_2)]$ or Slater determinant
 \rightarrow no interaction between electrons.
- One electron problem – one electron feels other electrons' charge in an average way.
- No considering of electron correlation.
- HF method is a non-linear self-consistent field method.
- Two electron integration is the most expensive part.
- Koopman's theorem \rightarrow HOMO energy = – Ionization potential,
 LUMO energy = – Electron affinity

Why Quantum Chemistry?

- If only we can get the exact or accurate solution of Schrodinger equation, we can expect all the properties of matters without experiment in principle!
- The basic mathematical quantum chemistry study to solve Schrodinger equation **by hand** has reached the **limitation**.
- But recent development of computational system like K computer enables us to access to the solution of Schrodinger equation of real molecules and solids.

Hartree-Fock method

- HF approximation excludes electron correlation
(correlation energy = exact energy – HF energy)
- The HF energy accounts for more than 99% of the energy, but ...
Ex) atomization energy of water molecule

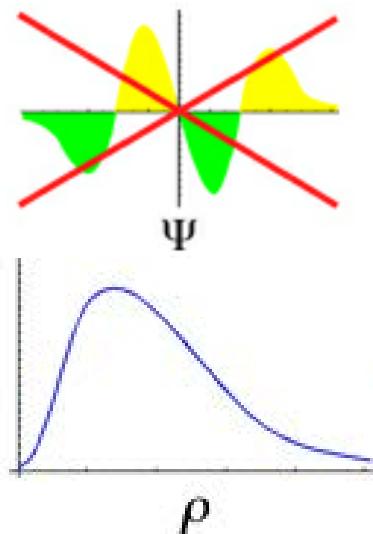

Energy	H_2O	$2 \text{ H} + \text{O}$	ΔE
E_{HF}	-76.057770	-75.811376	0.246393
E_{CCSD}	-76.337522	-75.981555	0.355967

The neglect of the correlation energy in the atomization energy of water makes a **30% error!**

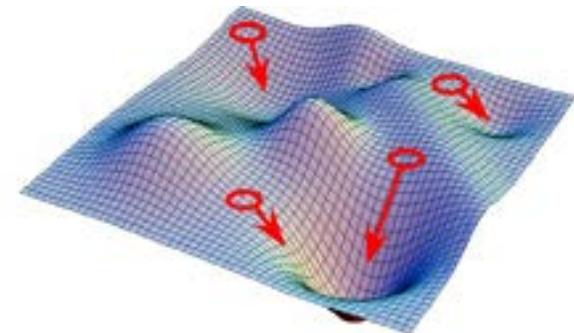

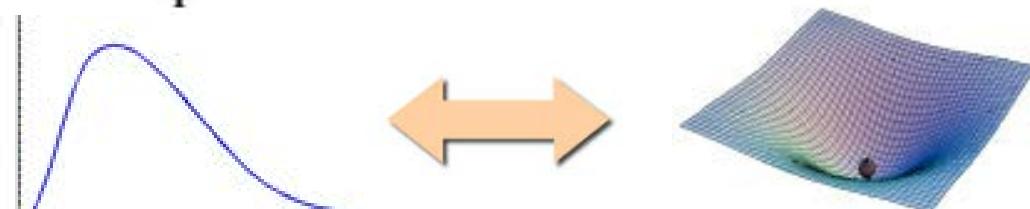

- So, it is not enough only to use Hartree-Fock method to get the energy of systems.
- However, electron correlation methods, such as CCSD, CCSD(T), CCSDT, show high order of system size as $O(N^{6\sim 8})$
cf) HF as $O(N^4)$

Hohenberg-Kohn Theorem

1. The ground state of electronic energy is determined completely by the electron density.

2. Variational principle:
For a trial density $\tilde{\rho}(r)$ such that $\tilde{\rho}(r) \geq 0$ and $\int \tilde{\rho}(r)dr = N$,

$$E_0 \leq E_v[\tilde{\rho}].$$

Kohn-Sham Equation

- Kohn-Sham Equation (introduction of orbital to DFT)

calculate the kinetic energy under the assumption of non-interacting electrons (same as HF)

$$T_s = (-1/2) \sum_{i=1}^N \int \psi_i^*(\mathbf{r}) \nabla^2 \psi_i(\mathbf{r}) d\mathbf{r}$$
$$\int \rho(r) = N$$
$$\langle \phi_i | \phi_j \rangle = \delta_{ij}$$
$$\left[-\frac{1}{2} \nabla^2 + \int \frac{\rho(r_2)}{r_{12}} dr_2 + v_{xc}(r_1) - \sum_{A=1}^M \frac{Z_A}{r_{1A}} \right] \phi_i = \varepsilon_i \phi_i$$
$$\rho(r) = \sum_i |\phi_i(r)|^2$$
$$v_{xc}(r) = \frac{\delta E_{xc}(\rho)}{\delta \rho}$$

- Let's simply write Kohn-Sham energy as

$$E_{\text{DFT-KS}}[\rho] = T_s[\rho] + E_{\text{ne}}[\rho] + J[\rho] + \boxed{E_{\text{xc}}[\rho]}$$

Density Functional Theory (DFT; 密度汎関数)

$$E_{\text{DFT-KS}}[\rho] = T_s[\rho] + E_{\text{ne}}[\rho] + J[\rho] + \boxed{E_{\text{xc}}[\rho]}$$

- Hohenberg-Kohn Theorem
- Kohn-Sham equation

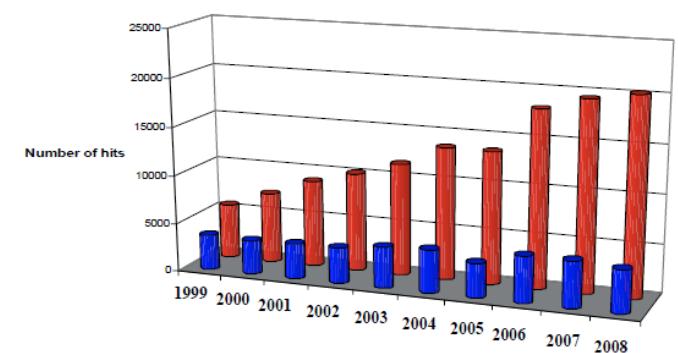

Exact exchange-correlation functional is not known yet.

A variety of functionals have been proposed till now.

- $O(N^{3\sim 4})$ is expected.
- Low dependency on the size of basis set.
- includes correlation energy.
- We expect DFT to be applied to **real-size biochemical systems** and **nanomaterials** using parallelizing and linear-scaling techniques.

Conventional DFT functionals

- **Pure DFT**: only uses electron density in expressing E_x and E_c
 - BOP : Becke88 Exchange + One Parameter (OP) correlation
 - BLYP : Becke88 Exchange + LYP correlation

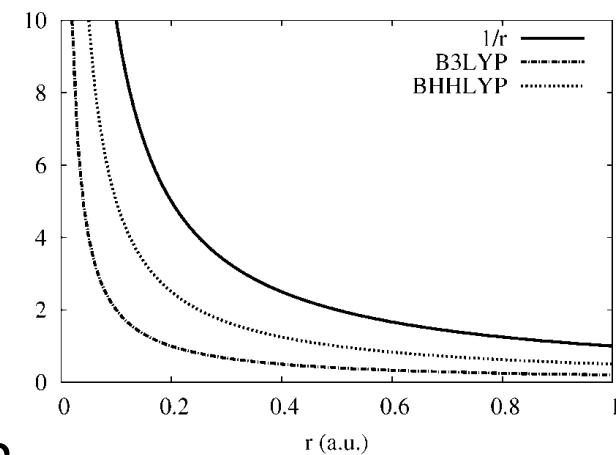

- **Hybrid DFT**: uses electron density and HF exchange integral

$$E_{DFT-KS} = T_s + E_{ne} + J + \boxed{E_x + E_c}$$

$$E_{xc}^{\text{hybrid}} = (1 - a_0) E_x^{\text{DFT}} + a_0 E_x^{\text{HF}} + E_c$$

B3LYP : $E_{xc}^{\text{B3LYP}} = (1 - a_0) E_x^{\text{Becke88}} + a_0 E_x^{\text{HF}} + E_c^{\text{LYP}}$; $a_0 = 0.2$

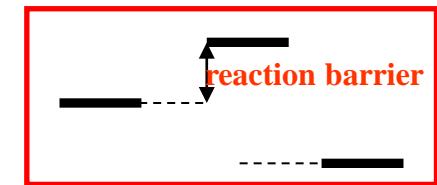

BHLYP : $E_{xc}^{\text{BHLYP}} = (1 - a_0) E_x^{\text{Becke88}} + a_0 E_x^{\text{HF}} + E_c^{\text{LYP}}$; $a_0 = 0.5$

The problem of DFT

The underestimation of reaction barrier height

Calculated reaction barrier height (kcal/mol)			
Reaction	BOP	B3LYP	Exp.
$\text{CH}_3\text{F} + \text{H} \rightarrow \text{CH}_2\text{F} + \text{H}_2$	3.4	5.9	9.0
$\text{NH}_3 + \text{H} \rightarrow \text{NH}_2 + \text{H}_2$	4.7	7.5	11.4
$\text{C}_2\text{H}_6 + \text{H} \rightarrow \text{C}_2\text{H}_5 + \text{H}_2$	2.8	4.9	7.3
$\text{CH}_3\text{Cl} + \text{Cl}^- \rightarrow \text{Cl}^- + \text{CH}_3\text{Cl}$	-3.8	-2.1	2.9
$\text{CH}_3\text{Br} + \text{Br} \rightarrow \text{Br} + \text{CH}_3\text{Br}$	-5.5	-3.9	1.7
$1,2,4,5\text{-C}_2\text{N}_4\text{H}_2 \rightarrow \text{N}_2 + 2\text{HCN}$	27.3	39.7	51.8
$\text{H}_2\text{O} + \text{OH} \rightarrow \text{OH} + \text{H}_2\text{O}$	-2.0	3.8	8.6
$\text{NH}_3 + \text{O} \rightarrow \text{NH}_2 + \text{OH}$	4.9	3.5	8.1
$\text{CH}_4 + \text{OH} \rightarrow \text{CH}_3 + \text{H}_2\text{O}$	-	1.3	4.7
$\text{NH}_3 + \text{OH} \rightarrow \text{NH}_2 + \text{H}_2\text{O}$	0.7	-3.2	1.4

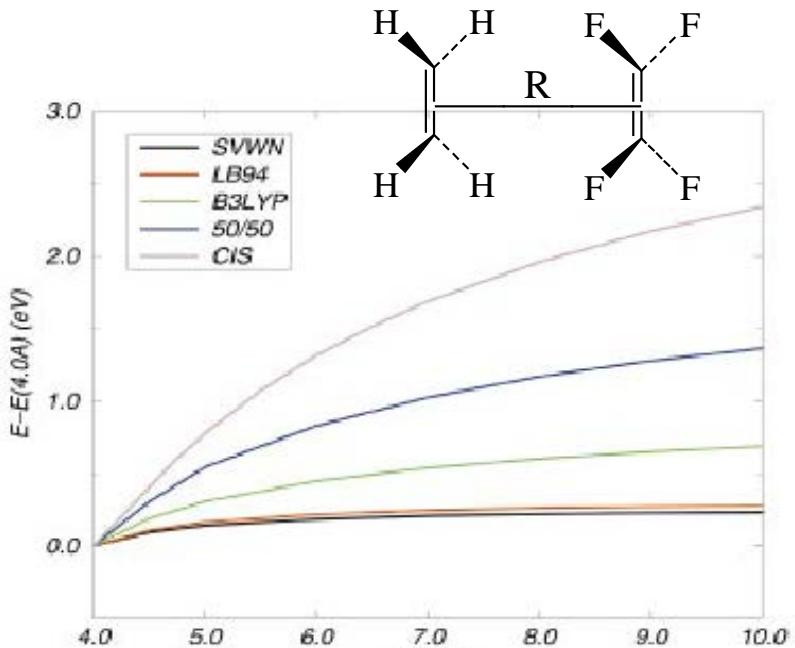

Pure (-3~10kcal/mol) and hybrid DFT (-3~5kcal/mol) underestimate reaction barrier height

Self-interaction error of conventional DFT

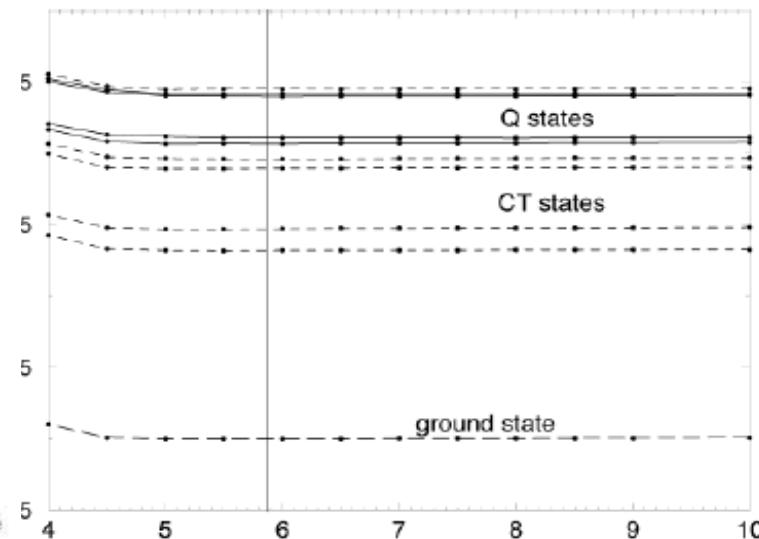

The problem of DFT

The underestimation of charge transfer and Rydberg excitation energy

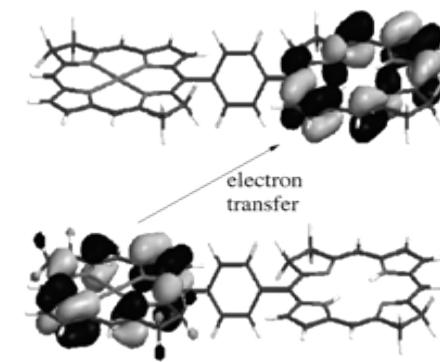

Dreuw, Weisman, and Head-Gordon,
JCP, 119, 2943 (2003).

Charge transfer excitations of
 $\text{C}_2\text{F}_4 \rightarrow \text{C}_2\text{H}_4$

Dreuw and Head-Gordon,
JACS, 126, 4007 (2004).

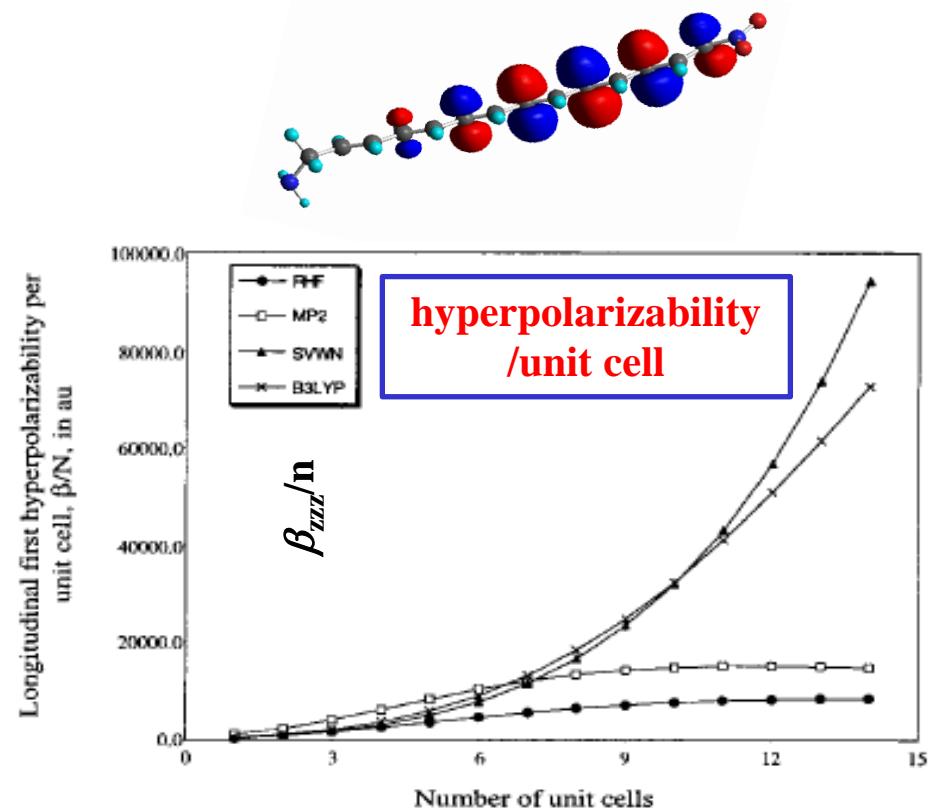

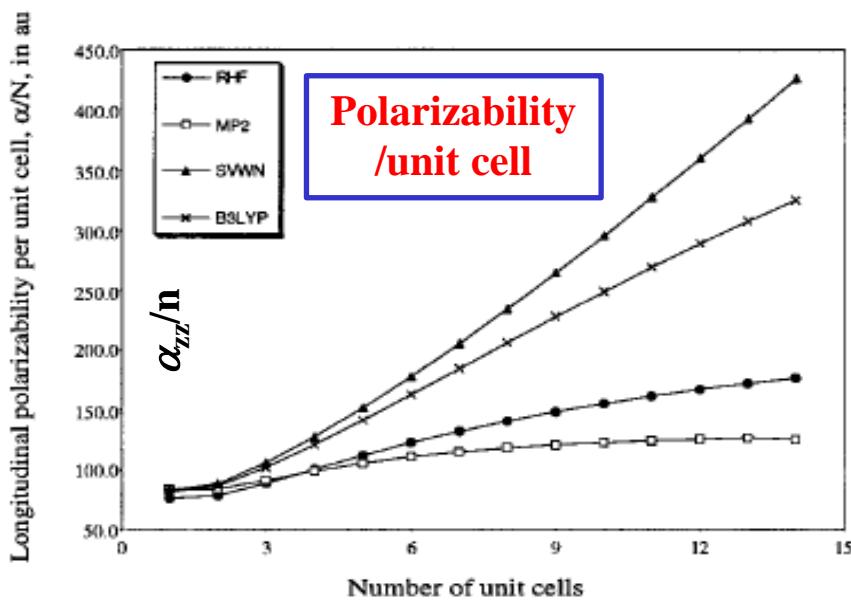

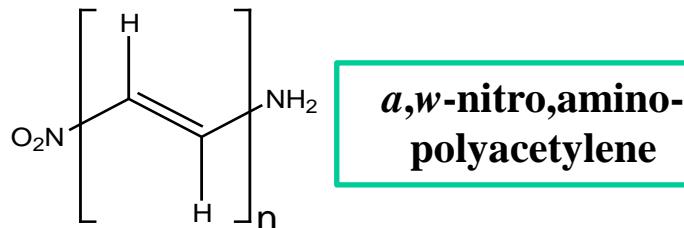

Charge transfer excitations of
 $\text{ZnBc} \rightarrow \text{Bc}$

CT states should be located higher than Q states.

The problem of DFT

The overestimation of linear and nonlinear optical property

Conventional DFT functionals overestimate polarizability and hyperpolarizability.

The problems of the DFT

- the underestimation of reaction barrier heights
- the underestimation of charge transfer and Rydberg excitation energies and the corresponding oscillator strengths
- the overestimation of linear and nonlinear polarizabilities and hyperpolarizabilities of long-chain molecules
- the poor description of van der Waals bondings
- the underestimation of alkane energies

All are the inter-electronic long-range properties!

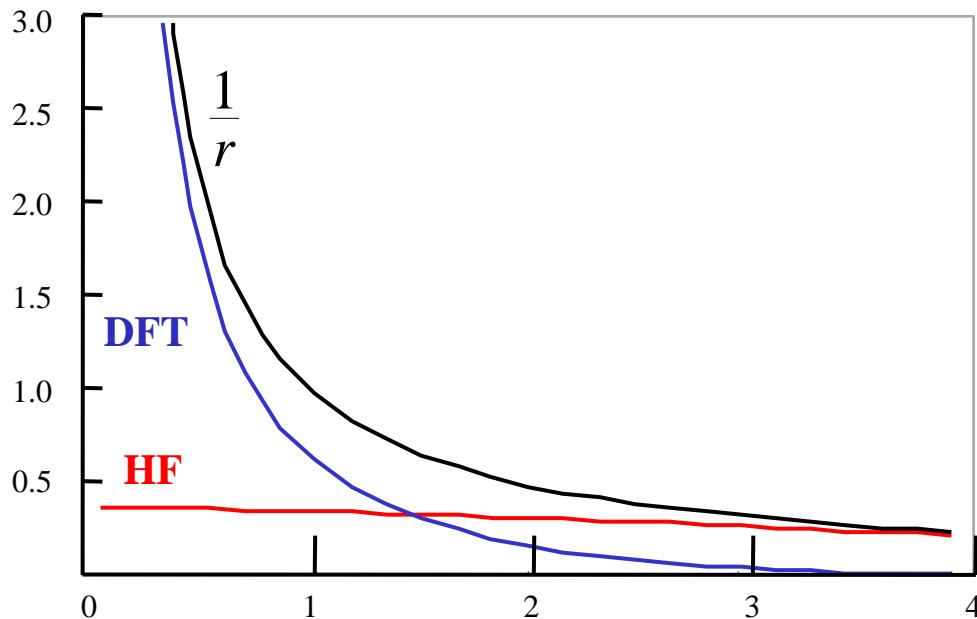

Long-range Corrected DFT

$$E_{DFT}[\rho] = T_s[\rho] + E_{ne}[\rho] + J[\rho] + \boxed{E_x[\rho]} + E_c[\rho]$$

$$\frac{1}{r_{12}} = \underbrace{\frac{1 - \text{erf}(\mu r_{12})}{r_{12}}}_{\text{short-range : DFT}} + \underbrace{\frac{\text{erf}(\mu r_{12})}{r_{12}}}_{\text{long-range : HF}}$$

short-range : DFT long-range : HF

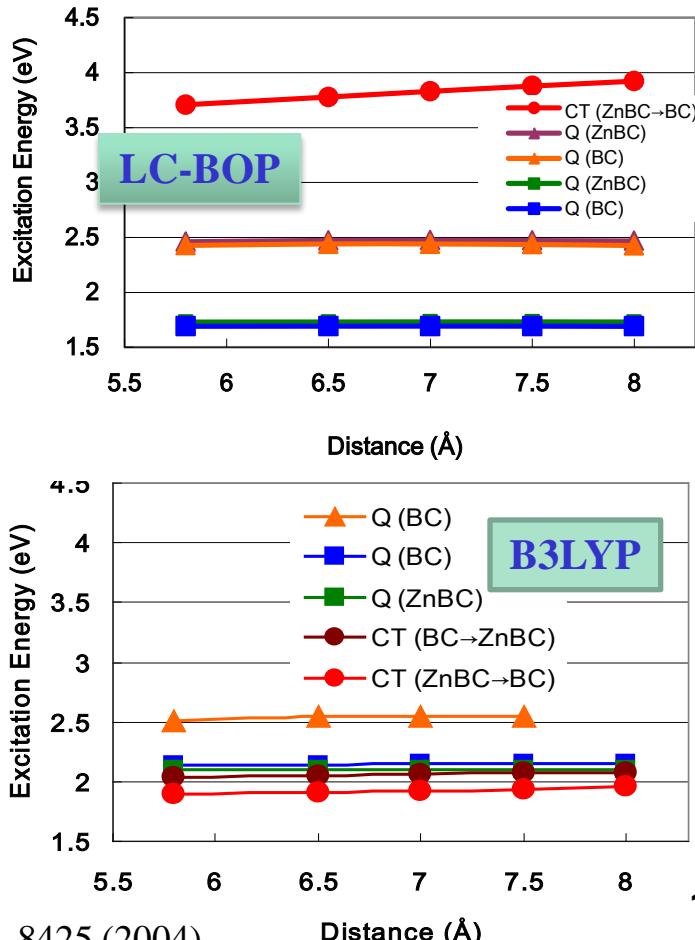

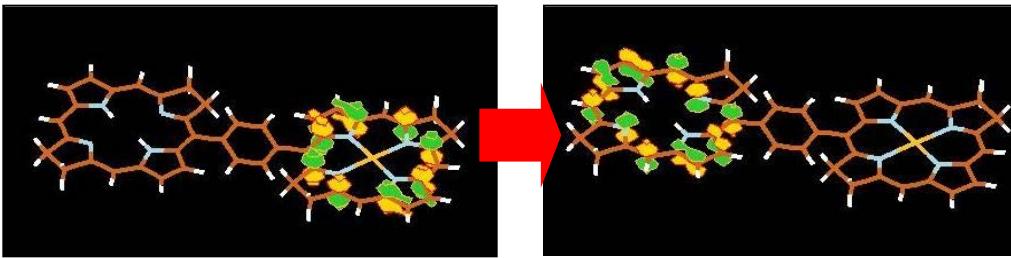

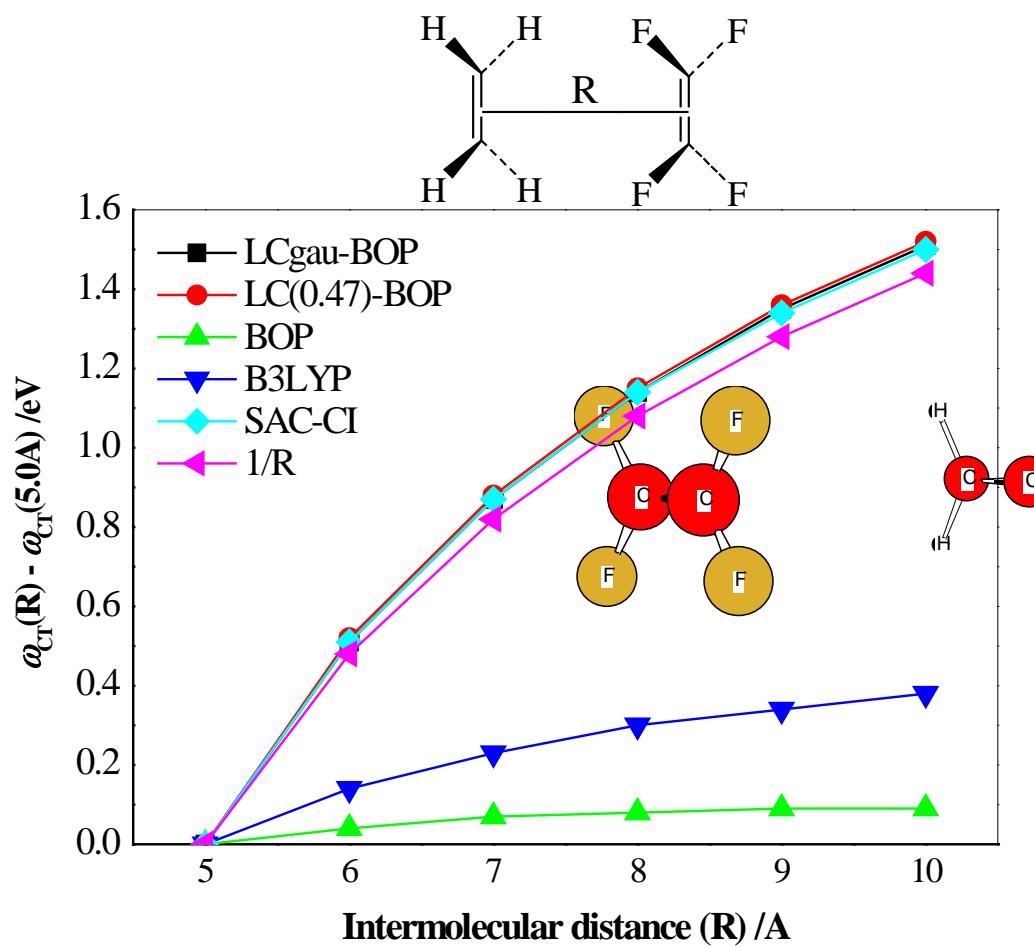

The only parameter μ was determined using atomization energy error of G2 set(148 molecules) and the critical problems above were clearly solved.

Ionization Potentials (Koopmans' theorem)

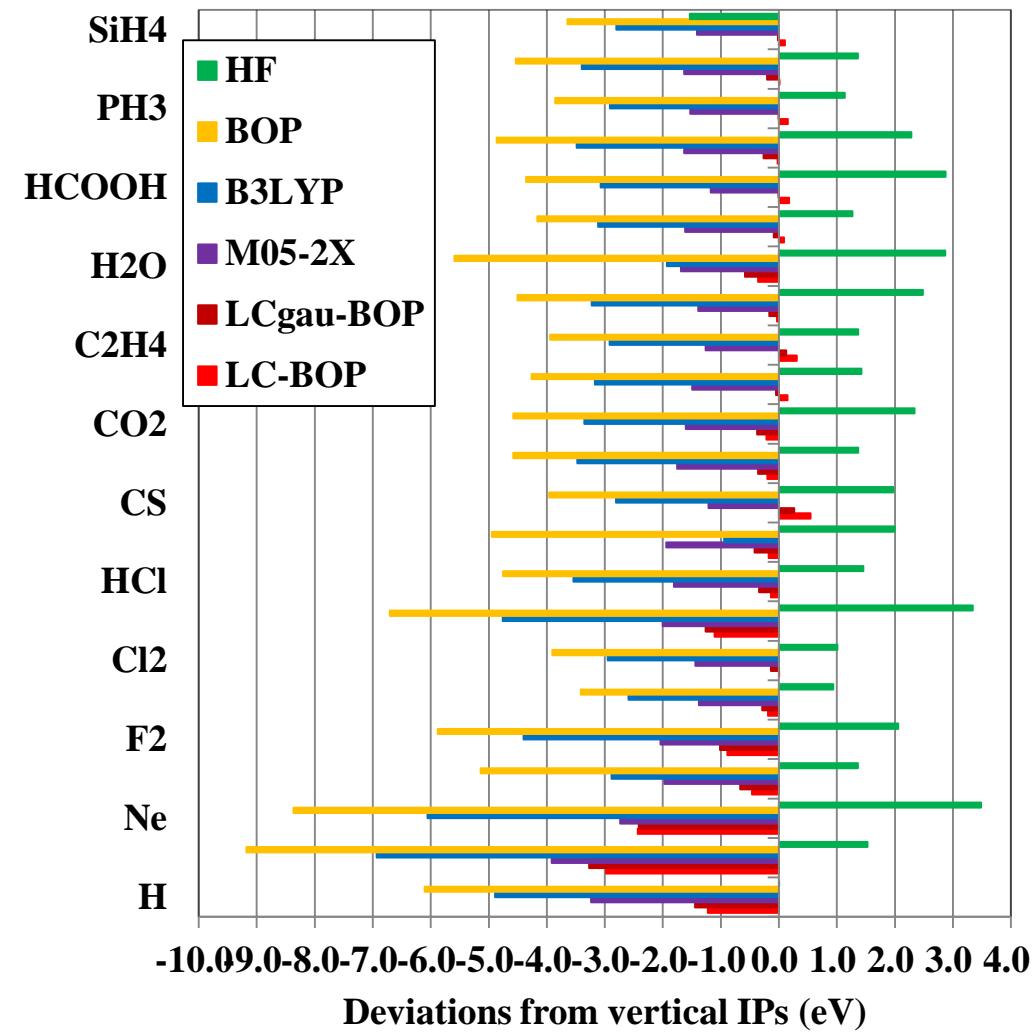

Fig. Deviations of orbital energies from the vertical IPs given by each method with aug-cc-pVQZ basis set ($e_{\text{HOMO}} + \text{IP}$).

LC calculations give orbital energies are very close to vertical IPs.

LC-DFT approximately satisfies Koopmans' theorem.

Orbital energies calculated by other DFT functionals significantly underestimate the vertical IPs.

HF orbital energies overestimates vertical IPs.
⇒ HF violates Koopmans' theorem due to the orbital relaxation effects after removing an electron.

Electron Affinities

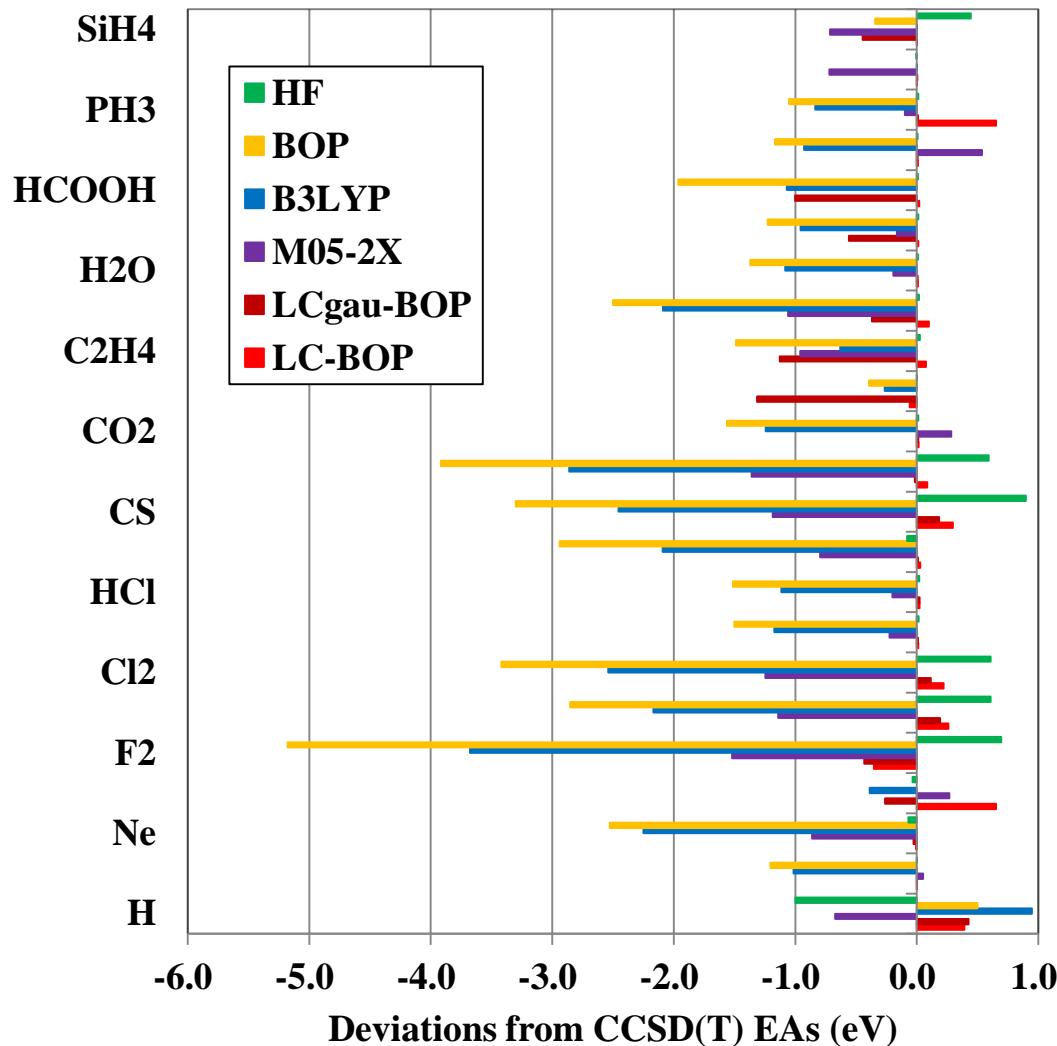

Fig. Deviations of LUMO energies from the vertical EAs given by each method with aug-cc-pVQZ basis set ($e_{\text{LUMO}} - \text{EA}$).

LC-BOP orbital energies are very close to vertical EAs for all systems.

LC-BOP also satisfies Koopmans' theorem even for LUMO.

Orbital energies given by other DFT functionals underestimate vertical EAs, although the deviations are smaller than those of HOMO energies.

HF orbital energies give accurate vertical IPs due to small orbital relaxation effects.
 \Leftrightarrow Koopmans' theorem is not applicable to virtual orbitals.
